

1. What I am most proud of
 - a. What I am most proud of in this project is creating a simple layout where my friends can view and make recipes without needing to dig through long pages. Honestly, this whole semester can be summarized with the word Burnout. So what I am honestly most proud of is that I made this website even with the amount of burnout I had. But I am proud that I was able to build a serving size calculator for recipes.
2. What I would do if I had more time
 - a. Create a full recipes page with multiple recipes displayed.
 - b. Add more recipes overall so the site feels complete.
 - c. Add more pictures of the cooking process. I was not satisfied with the pictures I took, so I used unsplash pictures instead.
3. Changes made after feedback
 - a. The javascript for the serving size calculator was not complete. So I fixed that.
 - b. I used the chrome tool lighthouse to find accessibility errors, and the changes I made were
 - i. On the home page, fix the color contrast in the card background color and small text and header text. To go from contrast ratio 4.01 to 7.2
 - ii. Made the title in the footer section go from h5 to h4 to follow the header hierarchy.
 - c. Replace a broken "See more recipes" button with two working recipes buttons in the home page.
 - d. Slightly darkened the recipe card and header background for better contrast and so it doesn't blend with the pages background.
 - e. I changed the text-muted bootstrap variable to be darker, because there are sections in the recipe pages where lighthouse detected bad color contrast using that bootstrap tag.
 - f. To reduce the text color contrast of the text on top of the images for recipes, I darkened the images so the white text can be more readable. So that the text won't blend in with the image behind it.
 - g. Match the font family on eating on a dime website. But made the "Eating on a dime" words on the top right a more fancy font called "imperial script"
 - h. Fixed the meta description and title from 'project 2:...' to Chicken noodle soup, seasonings, etc.
 - i. Fixed the page header in mobile view that the items are centered and have a light gray divider between each one.
4. Resources and assets I used / What they were used for
 - a. HTML/CSS/JS - for building and styling the cooking website.
 - b. Bootstrap - for layout and responsiveness for desktop, tablet and mobile views.
 - c. Chrome lighthouse to check for color contrasts and accessibility issues.
 - d. SCSS, with custom variables for colors and sizes in the scss files.
 - e. Imperial script from google fonts.
5. Justification of some of the key design choices.

- a. Single page layout: to reduce the length of a page, I tried to only put the information the user would want on the page. Reducing any fluff.
 - b. At the top of the recipe page, it shows an image of the recipe, and the difficulty and time it will take. So a user will be able to know from the start if they want to make it.
 - c. Added a custom serving functionality should allow the recipe to be adapted to multiple people for individuals, groups and families.
 - d. Had the logo become a fancy font style to make the website feel more authentic.
6. Ways that I customized the framework design
- a. Adjusted bootstrap variables like primary to be my own color of blue for example.
7. Advanced Features that I incorporated into my project
- a. Serving-size calculator
 - i. Recalculates fractions which was the hardest part
 - ii. Updates ingredients measurements instantly.
8. Problems that I experienced doing the project:
- a. The hardest one, which isn't per se coding related, was burnout. That was by far the hardest and most challenging part about this project.
 - b. However, the hardest coding problem I faced was doing the serving calculator. Trying to find out how to handle fractions was by far the hardest part.
 - c. Taking pictures of food that was professional. I tried to take pictures of the food I made. But I just wasn't satisfied with how the pictures looked on the website. I honestly should go back and replace the pictures with my own and add the change I talked about in the "if I had more time" section. But I am honestly just too burnt out to do it right now. After this semester is over and I have had a break, I am thinking of doing those touch ups so I can show employers. But right now this is what I have done.
